

# **Example**

## Building Massing Study

# Goals

## What are we solving for?

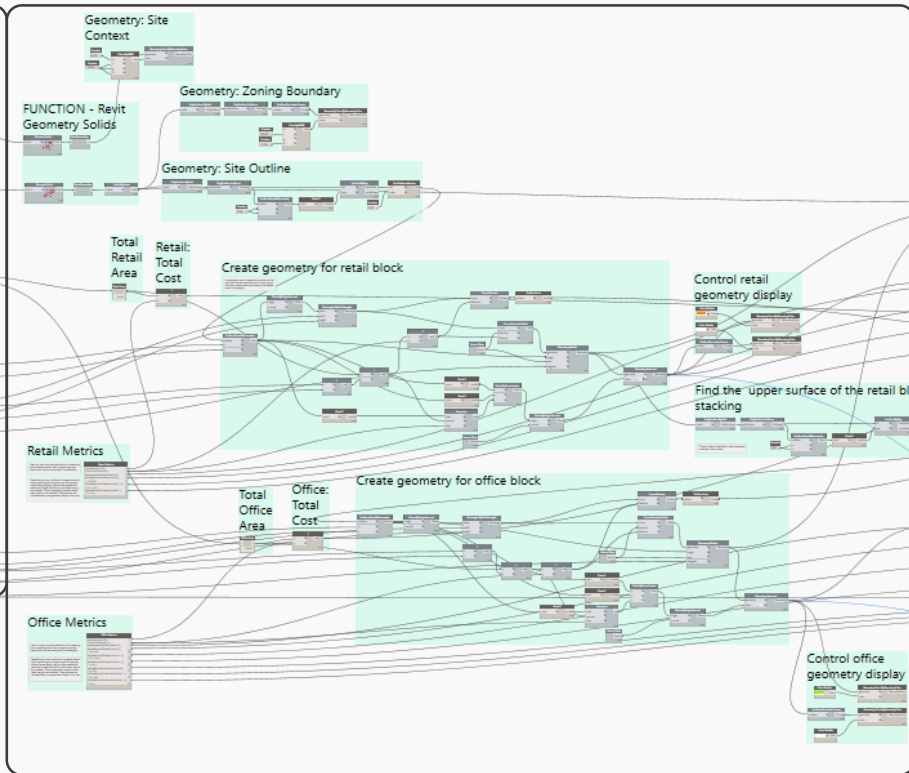

- Retail and office distribution and configuration for a building on an urban site.
- Variable Inputs:
  1. Ratio retail to office
  2. Program block size
  3. Program block rotation
- Goals:
  1. Minimize zoning envelop overlap
  2. Minimize cost
  3. Maximize total value per year

# Retail Metrics

Users can input cost and value factors for measuring and comparing options. Each program type may have its own cost and value return considerations.

Several factors may contribute to increased value of a floor pertaining to a program type. For example, offices that are higher, may be more valuable but retail that is higher (farther from the street) may be less valuable. Certain orientations towards certain views may be more valuable. These bonuses are calculated after some geometric analysis of the mass.

## Retail Metrics

```
CostPerSF=180;  
FloorToFloor=14;  
RevenuePerSFPerYear=35;  
ValueBonusElevation1=1;  
//0-50;  
ValueBonusElevation2=0.25;  
//51-150;  
ValueBonusElevation3=0.1;  
//151+;
```

Automatic Run completed with warnings.

# Office Metrics

Users can input cost and value factors for measuring and comparing options. Each program type may have its own cost and value return considerations.

Several factors may contribute to increased value of a floor pertaining to a program type. For example, offices that are higher, may be more valuable but retail that is higher (farther from the street) may be less valuable. Certain orientations towards certain views may be more valuable. These bonuses are calculated after some geometric analysis of the mass.

## Office Metrics

```
CostPerSF=300;  
FloorToFloor=15;  
RevenuePerSFPerYear=25;  
ValueBonusElevation1=1;  
//0-50;  
ValueBonusElevation2=1.2;  
//51-150;  
ValueBonusElevation3=1.5;  
//151+;  
ValueBonusOrientation1=1;  
//0-20;  
ValueBonusOrientation2=1.2;  
//21-40;  
ValueBonusOrientation3=1.5;  
//41+;
```

Automatic

Run completed with warnings.

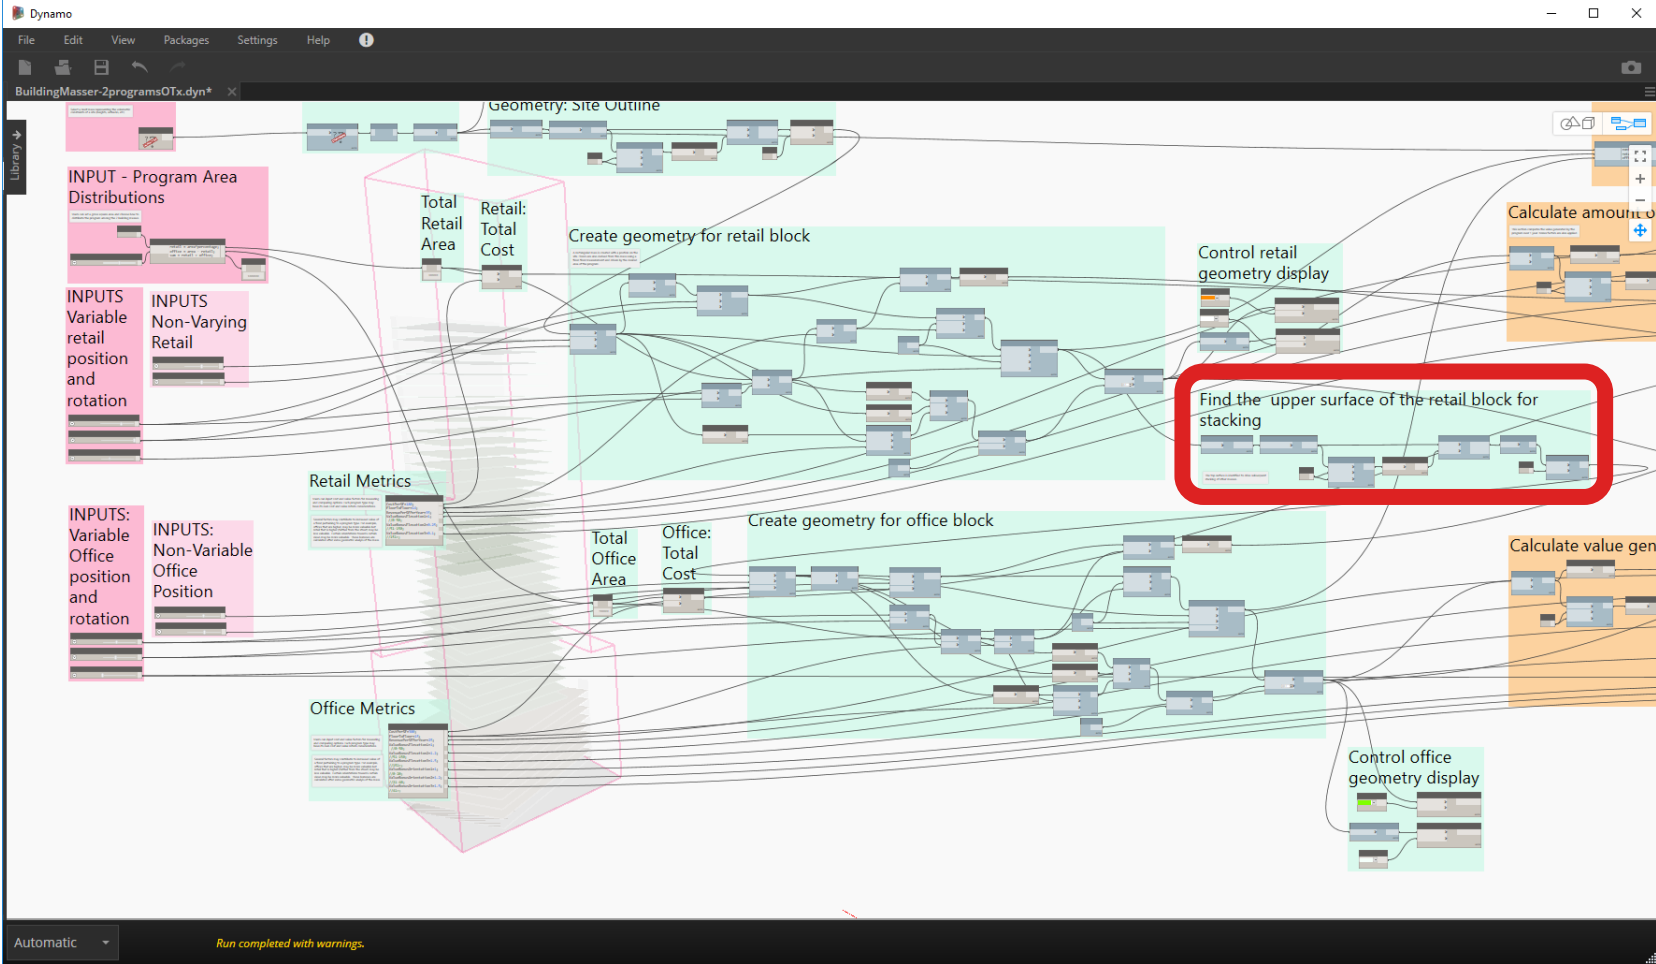

# Metric Comparison

## Building Massing Study

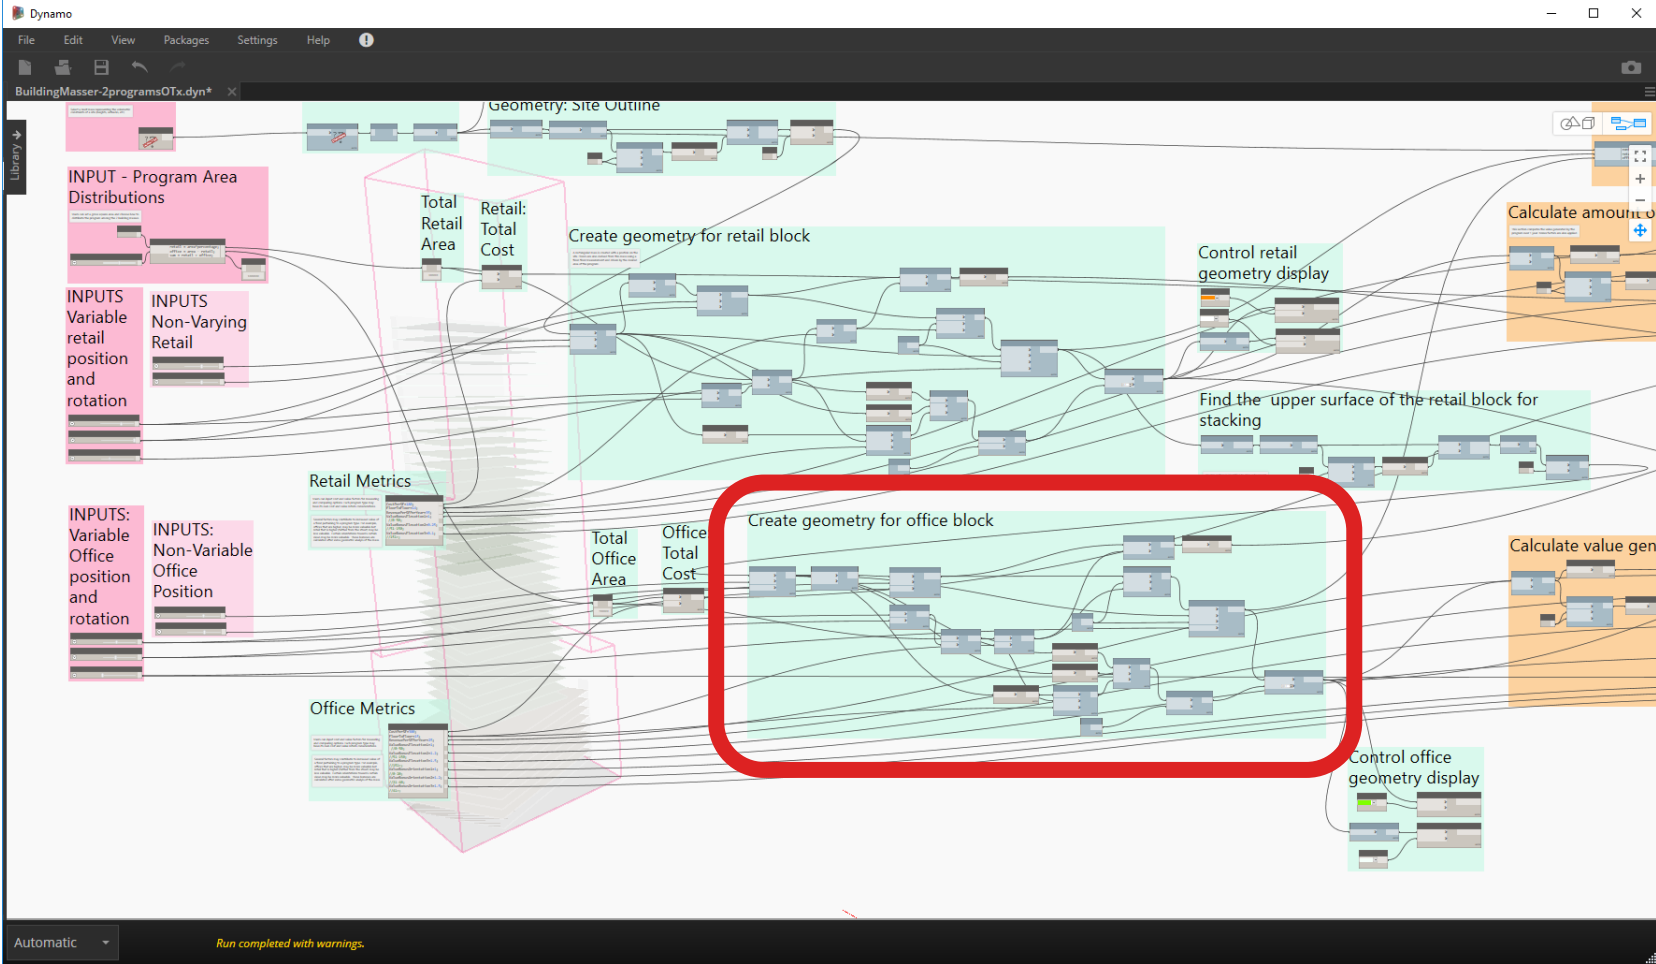

Metric	Retail	Office
Cost Per SF	\$180	\$300
Floor to Floor Height	14	15
Revenue/SF/YR	\$35	\$25
Elevation Bonus (0-50')	1	1
Elevation Bonus 51-150'	0.25	1.2
Elevation Bonus 151'+	0.1	1.5
Orientation Bonus 0-20	n/a	1
Orientation Bonus 21-40	n/a	1.2
Orientation Bonus 41+	n/a	1.5

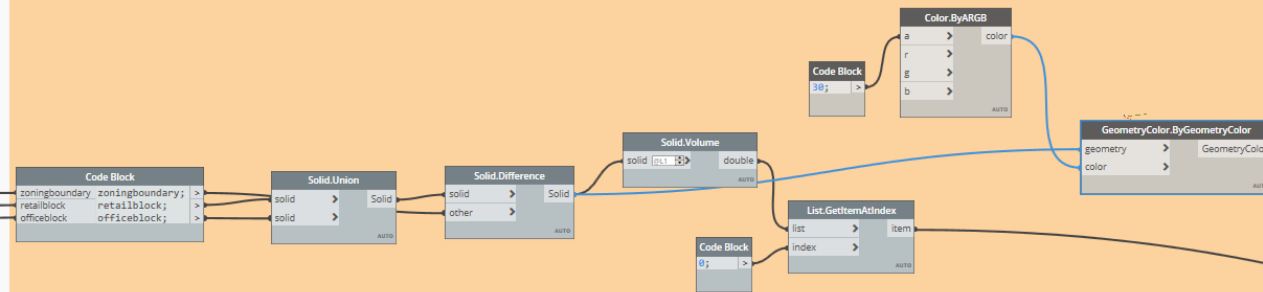

## Calculate volume outside zoning boundary

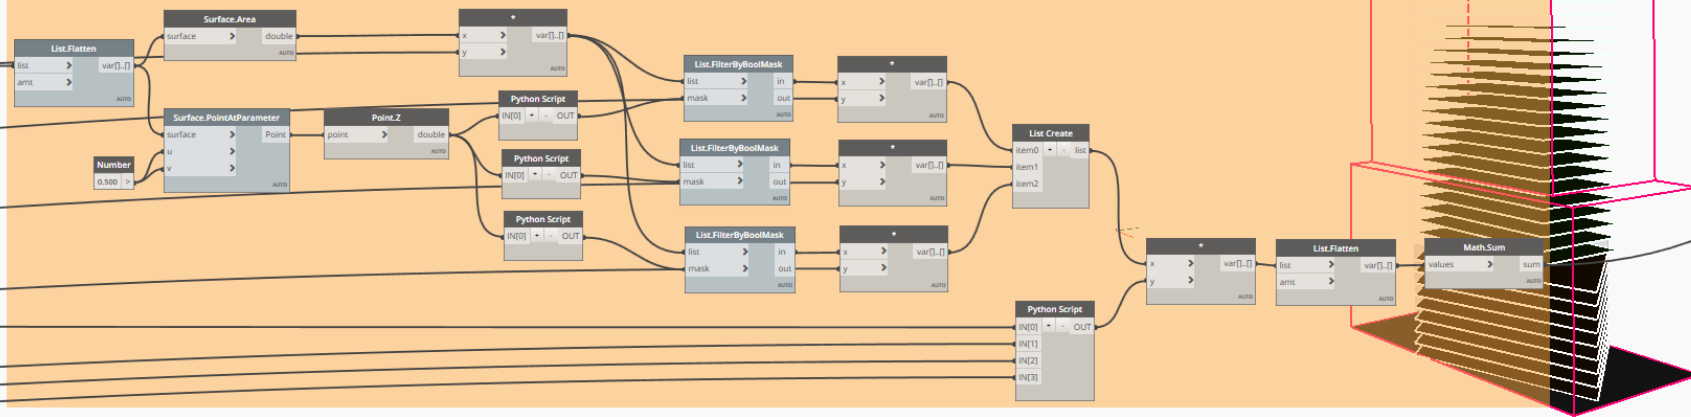

Calculate amount of value generated per year in the retail block

The screenshot shows a Node-RED workflow for calculating the surface area of a rectangular prism. The workflow is as follows:

- List.Flatten**: Receives 'list' and 'amt' inputs. Its output goes to **Surface.Area**.
- Surface.Area**: Receives the output from **List.Flatten** and a **Number** input of 0.500. Its output goes to **List.Create**.
- List.Create**: Receives the output from **Surface.Area**. Its output is split into three parallel paths.
- List.FilterByBoolMask** (x3): Each receives the output from **List.Create** and a **mask** input. The output of each goes to a **Math.Sum** node.
- Math.Sum** (x3): Each receives the output from a **List.FilterByBoolMask** node and a **values** input. The output of each is displayed in a 3D visualization of a rectangular prism.

Run completed with warnings.

# Calculate value generated per year by the office block

# OUTPUT - Overall Metrics

The overall metrics show aggregate clashes, cost, and value generated. These metrics can be used as fitness functions for Refinery to evaluate.

# INTEGRATE - Revit Output

```
graph LR; LC[List Create] --> LF[List.Flatten]; LF --> LC_Count[List.Count]; LF --> SPAP[Surface.PointAtParameter]; LC_Count --> Seq[Sequence]; Seq --> SFO[String from Object]; SFO --> CB[Code Block]; SPAP --> PZ[Point.Z]; PZ --> LBE[Level.ByElevationAndName]; SPAP --> PCJ[PolyCurve.ByJoinedCurves]; PCJ --> FBL[Floor.ByOutlineTypeAndLevel]; FBL --> FT[Floor Types];
```

The screenshot shows the Dynamo software interface with a workflow for generating Revit output. The workflow starts with 'List Create' and 'List.Flatten', leading to 'List.Count' and 'List.Flatten'. It then branches into 'Sequence' and 'Surface.PointAtParameter'. 'Sequence' leads to 'String from Object' and 'Code Block'. 'Surface.PointAtParameter' leads to 'Point.Z' and 'PolyCurve.ByJoinedCurves'. The final outputs are 'Level.ByElevationAndName', 'Floor.ByOutlineTypeAndLevel', and 'Floor Types'.
